iGET Technology
Induced Gene Expression Triggers

After three decades of international research and hundreds of independent field trials, ABM takes another giant leap in seed treatments with iGET™ Technology. Patent-pending blends of crop specific Trichoderma microbials include GraphEx-SA™ and Excalibre-SA™ for soybeans and SabrEx™ for corn and wheat. But the really big news is the yields – with average increases of 10 bushels per acre in corn, 3-5 bushels per acre in soybeans, and 7 bushels per acre in wheat.
