

iGETTM Technology

Induced Gene Expression Triggers

Get ready to grow more.

After three decades of international research and hundreds of independent field trials, ABM takes another giant leap in seed treatments with iGETTM Technology. Patent-pending blends of crop specific Trichoderma microbials include GraphEx-SATM and Excalibre-SATM for soybeans and SabrExTM for corn and wheat. But the really big news is the yields – with average increases of 10 bushels per acre in corn, 3-5 bushels per acre in soybeans, and 7 bushels per acre in wheat.
